4F: A Concise Review of Chemical Occupational Exposure Limits (OELs)

- How did they get these *&%\$! numbers?
- Is someone going to get hurt if they exceed a limit?
- How should I use them in a real situation (without reading a 200-page book)?

WEDNESDAY, MARCH 1, 2017 Indianapolis, IN

1

Abstract

- Occupational exposure limits (OELs) for chemicals have been a focus of health & safety in the US since the inception of the Occupational Safety & Health Act in 1970 where they were adopted wholesale from existing sources. These limits have been produced by several organizations, both inside and outside the US, and have a history prior to and since 1970. The different time periods for limits, along with multiple terms and acronyms, have made them confusing at time. When one adds to this confusion the complex aspects of toxicology it is easy to see how often one can get frustrated with understanding and applying OELs.
- This presentation will include: 1) A review of the history of OELs, 2) an explanation of the players who create them and how they differ in approach and purpose, 3) where to find listings of these OELs and their supporting documentation, 4) how there are created in simplistic terms and thus 5) how the should be interpreted and applied. Specific agents discussed will include nuisance dust, crystalline silica, asbestos, hydrogen sulfide, hydrogen chloride, methyl ethyl ketone, carbon monoxide, and lead

Selostverstandich mass ich mich eines Urteils darübe enthalten, in wie weit Arbeiter durch lange Gewöhnun höbere Werte zu ertragen im Stande sind, da mir in diese Hinsicht keine Beobachtungen zu Gebote standen.

Matt, Ludwig. (1889) Experimentelle Beiträge zur Ichre von der einwirkung giftger gase auf den menschen. Doetoral Dissertation, University of Wuzburg.

- 1921
- the US Bureau of Mines tables of exposure limits; 33 substances in the workplace
- 1941
- The Z-37 committee of National Standards Association [now ANSI] developed the first standard of 100 ppm for carbon monoxide. Prepared separate bulletins on 33 substances through 1974
- 1941
- An ACGIH subcommittee on Threshold Limits was formed under Committee on Technical Standards In 1942 the subcommittee reported a table of 63 substances and their Maximum Acceptable Concentrations (MACs). 1948, the MACs were renamed TLVs. 714 TLVs as of 2008.
- 1970
- OSHA's limits established with the Occupational Safety and Health Act of 1970. The 500 PELs OSHA initially adopted were ACGIH's 1968 TLVs and ANSI's 1966, 1967, and 1968 limits [543 as of 2008]

©2017, A Havics

5

OEL Brief History......

- 1976
- AIHA formed a Workplace Environmental Exposure Limits (WEEL) committee in 1976 to address substances for which no recognized occupational exposure limits (OELs) had been developed. Currently 131.
- 1989
- OSHA lowered the existing PELs for 212 toxic air contaminants and established PELs for 164 previously unregulated air contaminants. [376 more protective, 1 less protective] Court ended this in 1992. 455 Limits as of 2008.
- 2014
- OSHA Publishes intent to review PEL setting process. Introduces Control Banding.

Definitions of Exposure Limits

- Permissible Exposure Limit (PEL) [Legally Binding]
 - An employee's exposure to any substance...shall not exceed the 8hour TWA given for that substance for any 8-hour work shift of a 40hour work week
- Threshold Limit Value (TLV) [Good IH Practice Guidance]
 - TLVs refer to airborne concentrations of chemicals substances and represent conditions under which it is believed that nearly all workers may be repeatedly exposed, day after day, over a working lifetime without adverse effects
- Workplace Environmental Exposure Level (WEEL)
 - See TLV
 [Good IH Practice Guidance]
- Recommended Exposure level (REL) [Best Practice]
 - Occupational exposure limits recommended by NIOSH as being protective of worker health and safety over a working lifetime. This limit is frequently expressed as a time-weighted average (TWA) exposure for up to 10 hr/day during a 40-hr workweek

©2017, A Havics

13

Exposure Scenarios for Workplace OELs

- 8-Hour Time Weighted Average (TWA)
 - An average exposure over an 8-hr workday weighted by time of exposure
- Short Term Exposure Limit (STEL)
 - A STEL is defined as a _____TWA exposure which should not be exceeded any time during the workday
- Excursion (OSHA)
 - An Excursion is defined as a 15-minute or 30-minute TWA exposure which should not be exceeded any time during the workday

©2017, A Havics

Exposure Scenarios for Workplace OELs

- Ceiling Limit
 - Exposure shall at no time exceed the exposure limit given for that substance. If instantaneous monitoring is not feasible, then the ceiling shall be assessed as a 15-minute time weighted average exposure which shall not be exceeded at any time during the working day
- Peak Limit
 - Only for a maximum period of 5-30 min above the Ceiling Limit but below the Peak [per Table Z-2]
- Action Limit
 - A trigger level used to initiate requirements for periodic monitoring, medical surveillance, training, labels and other provisions (8-hour TWA). Usually ______ of the PEL-TWA.

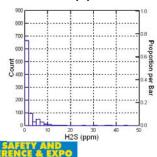

©2017, A Havics

15

Limitations of Ceiling Limit

- In theory, you can have issues:
- Hydrogen Sulfide
- 5 Second Measurements from 0-200 ppm

©2017, A Havics

16

Hydrogen Sulfide – A Health Threat?

Measured Maximum	Time Period for	
TWA (ppm)	TWA (min)	Limit (ppm)
5.7	30	100 IDLH
10.2	15	20 Ceiling
12.9	10	50 Peak
200	0.083 (5 sec)	?

5. How are they created?

- Analogy
- Correlation
- Low Dose Extrapolation
- Margin of Safety Approach
 - Direct NOAEL/LOAEL Approach
 - Benchmark Dose (BMD)

©2017, A Havics

23

Analogy To Acetic Acid

$$O$$
 $H_3C - C - OH$

Acetic Acid

 O
 $H_3C - CH_2 - C - OH$

Propionic Acid

 O
 $H_2C = C - C - OH$

Acrylic Acid

*Vacated

©2017, A Havics

Correlation

- Compares specific quantifiable property related to potency
- OEL = $(PP_a / PP_b) \times OEL_b$
 - PP = physicochemical property
 - PP must be established as a valid predictor of the biological effect upon which the OEL is based

©2017, A Havics

25

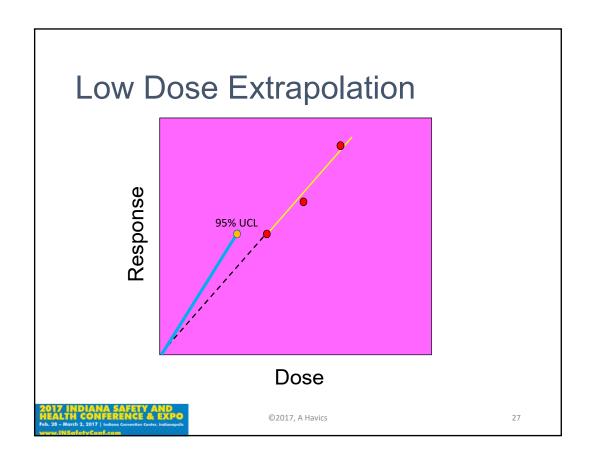

Correlation

- OEL for propionic acid based on irritation potential
 - Irritation potential = f(acidity) = f(pK_a)
 - Bromopropionic acid = 70x more acidic than propionic acid
 - OEL_{bromopropionic acid} = TLV_{propionic acid} / 70
 - OEL_{bromopropionic acid} = 10 ppm / 70
 - OEL_{bromopropionic acid} = 0.14 ppm
 - According to methods developed by Alarie, for sensory irritants:
 - TLV = $f(RD_{50}) = 0.03 (RD_{50})$ or $0.01(RD_{50})$
 - RD50 for Hydrogen Chloride = 309 ppm
 - OEL = 3 ppm to 9 ppm; PEL is 5 ppm

7. Application

• Silica

TABLE Z-3-MINERAL DUSTS

Substance	mppcfa	mg/m³
Silica: Crystalline Quartz (Respirable) Quartz (Total Dust)	250 b %SIO ₂ +5	10 mg/m ³ % SiO ₂ + 2 30 mg/m ³ % SiO ₂ + 2
Cristobalite: Use ½ the value calculated from the count or mass formulae for quartz Tridymite: Use ½ the value calculated from the formulae for quartz Amorphous, including natural diatomaceous earth Cristolog (loss than 1% countailing silled);	20	80 mg/m ³ %SIO ₂

- Current ACGIH TLV 50 ug/m³ as an 8-hr TWA
- Proposed OSHA PEL of ______ as an 8-hr TWA
 - "quartz, cristobalite, and/or tridymite"

©2017, A Havics

Asbestos Is the Exposure OK?

- OSHA PEL = 0.1 f/cc 8-
- ACGIH TLV 0.1 f/cc 8-hr

Sample #	Concentration	Time (min)	
1	1.2 f/cc	30	
2	0.01 f/cc	240	
3	0.05 f/cc	120	
4	0.02 f/cc	120	

©2017, A Havics

35

Tony's Interpretation

Category	Quality	95% Upper Limit Range	Chance of Trouble with OSHA
0	Very Good	0-1% of OEL	Fat Chance
1	Good	>1-10% of OEL	Very Unlikely
2	ОК	>10-50% of OEL	Unlikely
3	Marginal	>50-100% of OEL	Possible, on a rare occasion
4	Bad	> 100% OEL	Very Likely
